ABSTRACT

I know that in this present age there are so much advancement in the technology almost in every field, that can help one make routine work easier and reduce the burden and botheration. I mostly see that the manual work of managing data like record keeping in most libraries is a very lengthy and irritating procedure.

This project intends to develop a windows application by using the general concepts of Database Management Systems. Converting a manual "Library management system" into a "Windows based Library Management System" is the highlight of this project. This application will allow the users to operate the program as an administrator (Admin), student user as well as a normal user. By means of this application information can be easily shared and it will become a much easier task for the users to communicate and interact with all other users and admin users remotely. Student users as well as registered users will be capable of viewing the collection of books in the library,. On the other hand admin users will be able to maintain the whole library system through computers and operate the application with ease and much more accuracy. Admin users will also be able to generate different types of statistical data required for the library, and store, edit, and update unlimited data in a more secured way.
